

Hobbeast — Üzleti kérés összefoglaló

Verzió: 1.9.7 Dátum: 2026-09-05

Security

Production release-path closure. The Warm Social Field Guide UI remains intact, while the repository, CI and hosted secret configuration now satisfy the automated release gates that previously stopped v1.9.6.

Removed .env from Git tracking without deleting or changing the operator's local file, expanded the ignore policy to every .env.* variant except .env.example, and documented the complete browser configuration surface with blank examples. Verified that the service-role credential found in historical repository content is rejected by the GeoData project. Replaced the Hobbeast Edge integration's legacy GeoData service-role value with the project's current server-side secret key. Updated the GitHub Actions VITE_SUPABASE_PUBLISHABLE_KEY secret and both CI runtime target refs to the current Hobbeast Supabase project. Raised Vite, Vitest, React Router, PostCSS, Tailwind and the ESLint toolchain to supported secure patch/minor lines, refreshed vulnerable transitives, and removed the unused Recharts wrapper/dependency that was the sole source of the unresolved Lodash advisory. Regenerated the committed CycloneDX SBOM from the final lockfile.

Fixed

Replaced the unavailable lovable-agent-playwright-config template import with a native Playwright configuration and retained a compatibility fixture entryptoint. Gave the GitHub Actions unit-test step explicit public Supabase runtime config; the formerly tracked .env had silently supplied it before repository hygiene was fixed. Kept the full OrganizerDashboard characterization contract intact while giving its multi-tab async scenario a CI-safe 15-second timeout instead of the flaky 5-second default. Repaired the duplicate hobbeast-un8i Vercel Git integration whose sensitive Supabase variables existed with empty values. Production/Preview config was synchronized and the failed deployment was rebuilt to READY; canonical domains remain assigned to the hobbeast project. Updated the release runbook from the retired Lovable publication path to the actual GitHub main → Vercel production path.

Verified

bun install --frozen-lockfile and bun audit --audit-level=high — PASS; zero high/critical dependency findings. bun run security:secrets, bun run security:audit, bun run typecheck, bun run lint, bun run test, bun run build, bun run quality:performance and bun run release:validate — PASS (lint retains 14 pre-existing warnings; unit suite remains 59 files / 323 tests). Playwright — PASS: 6 unauthenticated/runtime checks passed; the single mutating, authenticated staging scenario was intentionally skipped because no disposable fixture was supplied. GitHub Actions initially exposed the missing unit-test runtime config; the failure was fixed in the workflow rather than hidden or reclassified. The canonical and duplicate Vercel commit-status contexts both completed successfully after configuration repair.

Operational boundary

AWS Location and Mapy browser keys remain public client configuration. Provider-side origin/service restrictions and rotation remain an operator security-hardening task; they are recorded as residual quota risk rather than being represented as private frontend secrets.
