

Hobbeast — Üzleti kérés összefoglaló

Verzió: 1.27.0 Dátum: 2026-09-05

The two sites that looked empty

A stubborn site can now be taught — with a rule, never with a script.

funzine.hu and sportagvalaszto.hu reported "no programs" while being visibly full of them. Neither hides an API: funzine's WordPress REST namespaces contain no events plugin at all, and its /category/programok archive holds editorial ARTICLES — the programs live inside their bodies, as dated h2/h3 sections of a listicle. sportagvalaszto.hu/nagy-sportagvalaszto/ is not a catalogue either; it is one recurring event's landing page, its date in prose. wp-posts mines article bodies through the always-present wp/v2/posts endpoint. Measured live: funzine 0 → 39 programs collected. page-prose reports the single event a landing page is about (sportagvalaszto 0 → 4). A dated heading is not automatically an event. The first run offered "Miért érdemes csatlakozni?" and a quiz headline as programs; a heading now has to look like the NAME of something — no questions, no section words, and a proper-noun marker — before it is published. Venue and city come from the listicle convention "Tábor Fesztivál // Alsóörs". The publisher-name venue fallback is restricted to single-venue recipes: forty programs at forty addresses must never all be pinned on the magazine.

Rules, not generated code

For sites with no structured data at all, the collector is now taught by a declarative rule — which element repeats, and which selector inside it holds the title, the date, the link. The rule is data. Nothing it says is ever executed, which is why it is safe to accept one from a language model; a generated scraper that the server runs would have been remote code execution by design, with a stranger's HTML as the model's input. A tolerant HTML parser and a deliberately restricted CSS subset: tag, .class, #id, [attr] with =/^\$/*, descendant and child combinators, and :nth-of-type(N) — the one pseudo-class that earns its place, because Hungarian listings repeat an identical wrapper for date and venue. An unsupported selector is reported, never silently ignored. scrape_rule jsonb on the source registry (migration 20260826160000), with the database refusing a selector source that has no rule. The worker renders with Playwright first and then applies the SAME interpreter the preview uses, so JS-built listings work and a rule that tests green extracts the same programs in production. Admin UI: editable rule JSON, one-click container candidates drawn from the classes that actually repeat, "test the rule" showing real sample programs, and an AI suggestion validated against the schema before it is ever shown. Live proof on a source that had produced nothing: pecs.hu/programok

Fixed

An ISO timestamp's UTC offset (" +02:00") reads exactly like a clock, so a generic time pattern turned 20:00 into 02:00. The timestamp's own time now wins over any pattern found in free text. The source-manager Edge Function bundles a verbatim copy of the recipe engine; deploying it by hand is how the preview and production drift apart. CI now deploys it on any change under supabase/functions, after checking the copy is in sync — and explains what is missing instead of failing when the Supabase credentials are not configured.

Ez az összefoglaló 2026-09-05-én készült visszamenőleg, a CHANGELOG.md megfelelő bejegyzéséből származtatva, mert ehhez a verzióhoz eredetileg nem készült versioning-artefaktum. A tartalma a changelogloból ellenőrizhető; nem a kiadás napján kelt dokumentum.
