

BUSINESS REQUEST SUMMARY / 2026-08-24

Budapest is full of shared stories.

Hobbeast v1.9.9 turns a capable product into a distinctly human Budapest brand - with original editorial media, one calm motion signature and no feature loss.

Product

Hobbeast 1.9.9

Change

19082410

Delivery

Additive UI + media

The request

Continue the premium direction using Bumble BFF and Loopie as flow references. Add people-first Budapest nightlife, games, sports and dog-walking imagery, use motion without visual overload, preserve every existing capability, then commit and deploy the verified result.

Four scenes, four product roles

The visual system distributes human energy across the journey instead of stacking animation on one page.

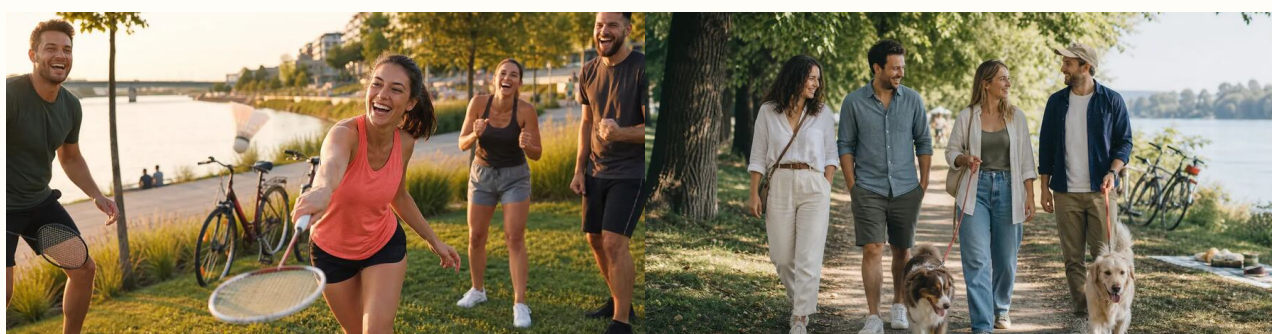

Home / invitation

Five friends and the Budapest night establish possibility. Desktop gets optional calm motion; mobile stays static.

Explore / identity

A laughing garden game night turns category search into a warmer statement of belonging.

Events / momentum

A Duna-side badminton moment gives the existing filter engine a vivid, active entry point.

About / trust

A relaxed dog walk supports the message that visitors do not need an established group to join.

Originality and evidence

- All four scenes were produced with built-in ImageGen from text-only Hobbeast prompts; no competitor image or video frame was an input.
- The committed provenance ledger records the prompts, transformations, metadata, file sizes and SHA-256 hashes.
- Synthetic adults are editorial subjects, not real member testimonials or documentary evidence of a named venue.

Motion that remains under control

The 10-second signature is progressive enhancement, never a prerequisite for the product experience.

Fast and bounded

VP9 WebM: 509,867 bytes. Faststart H.264 MP4: 832,872 bytes. Both are 1280x720, 24 fps, 10 seconds and audio-free.

Respectful by default

No video module or request on mobile, Save-Data, 2G or reduced-motion. The eager poster remains the LCP asset.

User-controlled

A visible 48x48 px keyboard control pauses or resumes motion. The video also pauses offscreen and in hidden tabs.

Fail-closed budgets

Each video must remain below 1.5 MB; the required two-variant pair must remain below 2.5 MB in total.

Protected product contracts

- All routes, authorization boundaries, discovery states, event lifecycle actions, organizer/admin controls, privacy rules and disclosures remain intact.
- Events retains q, source, mode, date, capacity, distance, km, cat, sub, activity, circle and create URL behavior.
- Explore retains the category to subcategory to activity state machine and its search field.
- The new About and hero entry points terminate in existing Events and Explore routes; no fake parallel flow was introduced.

One motion surface. Four distinct stories. Zero feature removal.

Verification and release boundary

Repository, local browser, CI and hosted production are separate evidence layers. This summary records each only after direct proof.

Frozen install	PASS - 439 installs / 498 packages; no changes
TypeScript + ESLint	PASS - zero errors; 14 pre-existing warnings
Vitest	PASS - 59 files / 323 tests
Production build	PASS - 3,196 modules
Performance	PASS - media pair 1,342,739 bytes; CSS under 20 KiB gzip
Responsive + media E2E	PASS - 13 checks; 1 authenticated fixture skip
Interactive browser	PASS - Home, Explore, Events and About

Release boundary

The authenticated, mutating staging journey remains intentionally fixture-gated. A skipped mutation is not represented as production proof. Push, CI, Vercel deployment and live URL status must be recorded only after the remote systems complete.

Rollback

Revert the v1.9.9 UI, media and versioning commit as one slice and rebuild from v1.9.8. Keep the v1.9.7 release-path and security repairs. If motion alone fails, preserve the static poster and roll forward with corrected derivatives.
