

Hobbeast — Business Request Summary — v1.9.3

Date: 2026-08-24 | Release: 1.9.3 | Theme: Google login restored

Business request

Users clicking “Continue with Google” on expericentre.com received “Unsupported provider: provider is not enabled”. Restore Google sign-in on the new backend and prove it works before reporting success.

Root cause

The old Google login ran on the Lovable platform's managed OAuth client, which disappeared together with the Lovable deployment. The new Supabase project had no Google credentials at all.

What was delivered

- New Google OAuth client (“Hobbeast Web”) created in the customer's own Google Cloud project, with correct origins, redirect URI and authorized domains.
- Supabase Google provider enabled with the new credentials; the client secret is stored only in the Supabase configuration, never in the public repository.
- Auth URL configuration fixed: Site URL now <https://expericentre.com> (was localhost), plus a proper redirect allowlist for production, www, local development and Vercel.

Verification (performed personally, on production)

- Full Google flow: login page → Google account chooser → consent → logged-in session on expericentre.com.
- The Google identity linked to the user's existing account — no duplicate was created.
- Email/password login re-verified (HTTP 200 with access token).

Open items

- The Google consent screen is still in Testing mode; the “Publish app” button is expected to activate after Google-side propagation. Until then only registered test users can use Google login; email/password login works for everyone.
