

Hobbeast — Business Request Summary — v1.9.4

Date: 2026-08-24 | Release: 1.9.4 | Theme: full Edge Function rollout

Business request

Keep pushing: finish the backend feature rollout that the platform migration left incomplete, and force the Google sign-in publication forward as far as Google allows.

What was delivered

- All 26 backend Edge Functions are now live (the final 14 deployed this round): place search, routing, event imports and syncs (Ticketmaster, SeatGeek, Eventbrite), AI event proposals, hub event generation, bulk admin actions, venue seeding and the address-manager pipeline.
- Deployment switched to the official Supabase CLI pipeline — future deploys are a single command, with security flags applied automatically from the repository configuration.
- Every deployed function verified: correct security (JWT) settings, functions boot and answer with their expected contracts.

Google sign-in status

Analysis of the production database shows the only two Google-linked accounts belong to the owner; both are registered as test users, so the pending Google-side publication currently blocks no one. Publication itself stays greyed out on Google's side (documented propagation delay of minutes to hours) and will be pressed as soon as Google activates the button.

Open items

- External provider API keys (maps, ticketing) and SMTP must be configured by the operator for full feature parity; press “Publish app” when Google enables it.
