

Hobbeast — Business Request Summary — v1.15.0

Date: 2026-08-25 | Release: 1.15.0 | Theme: real events flowing via a Playwright scraper

Business request

Reuse the browser-automation tech from the SmartSearchTool/searchforge project so the event database actually fills with real Hungarian programs, running automatically in the cloud a few times a day for free.

What was delivered

- A separate, scheduled Playwright worker that opens JavaScript-heavy Hungarian event sites in a real browser (which the secure in-database pipeline cannot do), reads each event's structured data, and loads clean, dated events into Hobbeast.
- It runs automatically 3x per day on GitHub Actions — free, no server to rent — and can be triggered on demand.
- A controlled, validated loading gate: only real future-dated events with a title are accepted, and re-runs update instead of duplicating. The existing secure pipeline was left completely untouched.
- Proven live: 20 real concerts (Andre Rieu at MVM Dome, Demjen 80 at Papp Laszlo Arena, Budapest Bar at Margitsziget, Veronica Swift at Mupa, and more) are now loaded and visible on the Events page under 'Kulso programok'.

How it scales

Each new source is a small add-on module; no database or pipeline change is needed. Next candidates include welovebudapest and venue calendars. Events always link back to the original source.
