

Hobbeast — Business Request Summary — v1.14.0

Date: 2026-08-25 | Release: 1.14.0 | Theme: event-feed ingestion activated & scheduled

Business request

Make the RSS/event-feed ingestion actually run on a schedule so new programs flow into the event database automatically.

What was delivered

- The dormant ingestion pipeline is now fully switched on: security keys provisioned, an operator account authorised, and a recurring job scheduled to run every 3 hours automatically.
- The complete scheduled path was proven working end-to-end against the live database (the job fires, authenticates securely, and runs the ingestion cycle, returning success).
- The pipeline's safety and quality gates were verified: a test fetch correctly imported nothing as an 'event' when the source only had articles without dates — exactly as designed.

Honest status — why no new events appear yet

A review of ~18 candidate Hungarian sources found that today's event sites deliver their listings through in-browser JavaScript, not the static, machine-readable feeds (RSS/iCal/structured data) the secure fetcher needs. The engine and schedule are live and will publish automatically the moment a compatible source is connected — this is a source-availability gap, not an engine fault.

Recommended next step

Either extend the parser to read the event data embedded in modern JavaScript pages (unlocks large sources like tixa.hu), connect curated real calendar/RSS feeds, or use official ticketing APIs. Each is a focused follow-up.
