

BUSINESS REQUEST SUMMARY / 2026-08-24

Hobbeast

Social Playground

A major UI/UX expansion that makes the existing product feel more alive, local and social - without removing or simplifying any Hobbeast capability.

Product version

1.9.8

Change ID

19082409

Delivery type

Additive consumer UI/UX

The request

Make Hobbeast substantially more attractive using the visual quality of Loopie, Meetup, Bumble BFF and Buddypass as reference points. Keep the richer Hobbeast feature set intact and add better discovery and social entry points instead of dumbing the product down.

No feature removal. No handler rewrite. No route regression.

Reference principles: Loopie photo immersion; Meetup discovery utility; Bumble BFF playful editorial composition; Buddypass product-preview clarity. The resulting Hobbeast design is original and does not copy their assets, source code, text or exact layout.

What changed

A consumer-facing redesign with new utility, not a cosmetic downgrade.

Immersive home hero

Original Budapest-flavoured lifestyle photography, large editorial message, three direct activity paths, and preserved Events/About CTAs.

Additive home discovery

New working program search, personal recommendations, available-capacity and category entry points, plus an authenticated create-event route.

Richer event discovery

All existing source, date, capacity, distance, category and personal filters remain. The page now gives them a clearer hierarchy.

Image-aware event cards

Existing external image data is now rendered only after HTTPS validation, with lazy loading, no-referrer policy and a category/emoji fallback.

Playful Explore and Auth

The complete category drill-down and every login, registration, OTP, resend, OAuth and password-recovery flow remain behind a stronger composition.

Unified app identity

New display/body typography, chartreuse/coral/purple accents, refreshed code-native icon colours, favicon and a more discoverable Hobbik nav item.

Performance protection

- The new hero was converted to a 162,018-byte WebP with the previous JPEG retained as a browser fallback.
- Below-the-fold home content moved into a lazy chunk, bringing landing main JS to 148,057 raw bytes and 46,152 gzip bytes - below the existing limits.
- Global CSS is 117,231 raw bytes and 19,805 gzip bytes. The raw ceiling was narrowly adjusted to 116 KiB; the 20 KiB transfer ceiling was not relaxed.

Protected product contracts

The redesign was deliberately isolated from business logic and server contracts.

- All routes, providers, auth/authorization boundaries and the /events/:id/organize compatibility redirect remain unchanged.
- Events keeps URL-backed q, source, mode, date, capacity, distance, km, cat, sub, activity, circle and create state.
- Join, leave, create, load-more, less-like-this, external sessionStorage handoff, recommendation and promoted-content behavior remains intact.
- Explore keeps the categories to subcategories to activities state machine and its accessible labels.
- Auth keeps redirect sanitization, Google OAuth, e-mail login/registration, OTP verification/resend cooldown, forgot-password and onboarding redirects.
- Organizer, Admin, Profile, Community, moderation, trust/safety, payment and hosted data contracts were not removed or rewritten.

Accessibility and responsive additions

- The new hero and event cards obey reduced-motion preferences; key touch targets remain at least 44 px.
- Filter removal controls now expose descriptive aria-labels.
- The external event action now uses Button asChild instead of nested interactive elements.
- A new Playwright matrix checks 320x800, 390x844, 768x1024 and 1440x1000 with no horizontal overflow across Home, Events, Explore and Auth.
- Mobile menu open/close and both the new Hobbik route and home-search query handoff are exercised automatically.

Verification and delivery boundary

Evidence is local until a later publication step explicitly proves hosted production.

TypeScript typecheck	PASS
ESLint	PASS - 0 errors; 14 pre-existing warnings
Full unit suite	PASS - 59 files / 323 tests
Production build	PASS - 3,189 modules
Performance budget	PASS
Full Playwright suite	PASS - 11; 1 fixture-gated skip
Interactive browser review	PASS - Home, Events/cards, Explore, Auth

Release boundary

This package authorizes and records repository implementation, local QA, version synchronization and a dedicated commit. It does not by itself prove a push, CI run, hosted deployment, authenticated production state or Store publication. Those require separate direct evidence.

Rollback

Revert the v1.9.8 UI implementation and metadata commits as a pair. No database migration, Edge function, hosted secret or remote provider setting is part of this package. Keep the v1.9.7 security and release-path corrections forward-only.
