

Hobbeast — v1.9.0 business request summary

Date: 2026-08-23 · Package ID: 19082301 · Status: local runtime DB evidence GREEN; hosted execution HOLD

Business request

The production program (Prompts 01–15) was complete at source level but every release decision remained HOLD for one central reason: no repository migration had ever been proven against the real production database. The database itself was exported from Supabase to local storage (E:/databasebackup/Hobbeast) for cost reasons, so no live environment existed to test against. The request: continue the development by closing this evidence gap without touching any hosted project, and repair whatever the proof uncovers.

What was delivered

Reproducible DB verification gate. `bun run db:verify` — restores the 2026-06-18 production dump (933 users) into a disposable local PostgreSQL 18 cluster, replays all pending migrations and runs the 15 SQL acceptance fixtures. A `--mode=fresh` variant proves a new environment can be built from the repository alone.

Migration chain unblocked. The chain was proven broken: a constraint re-add rejected existing rows and made all 52 pending migrations unreachable. Three historical (still unapplied) migrations were repaired.

Production drift repaired (new migration 20260823010000). Row-level security was found DISABLED on 5 tables whose policies the program kept extending; anonymous clients held full write grants; a live-only policy exposed every private profile column to any signed-in user; direct participant writes could bypass the audited state machine; the waitlist auto-promotion trigger was missing; three CHECK-constraint pairs contradicted each other. All repaired in one reviewed, rollback-documented migration.

Latent runtime bug fixed. `complete_event_atomic` crashed on the production schema (time vs timestamp type conflict) — found only because the replay ran against real schema, not source assumptions.

Evidence

Gate	Result
db:verify (restore mode)	PASS — restore 0 errors; 51+2 migrations; 15/15 fixtures
db:verify (fresh mode)	PASS — full chain + 15/15 fixtures
Unit/component tests	PASS — 59 files / 323 tests
TypeScript / dev build	PASS / PASS
release:validate / secret scan	fail-closed by design (.env tracked — operator P0)

What remains open (operator-owned)

Hosted re-import of the database and applying the 53 pending migrations; .env untracking and credential rotation (P0); Deno/Edge runtime tests; Playwright end-to-end runs; legal, safety and launch approvals per docs/GO_NO_GO_REPORT.md. No deploy, push or hosted change was made in this package.

Derivation note

The companion artifact `versioning/19082301_v1.9.0_ai_dev_prompts.md` is derived from this summary and carries the continuation instruction for the next development agent.
